The monument Orebunker is released and staged as a spectacular solitaire. The competition idea of a solar system on the bunker is realized. The plant, which gives the property the new name of solar bunker, currently consists of more than 1,600 photovoltaic modules and produces up to 320,000 kWh of electricity depending on the intensity of the sunshine. In the geometry of the building form a fence secures the monument. In the western part of the 200 -meter-long concrete sculpture the innerside is accessible and offers a view into the imposing underworld of the plant. Under the northern funnel an asphalt track on the entire length, as an inline skate track
